

BagPak 2000-AD (Bulk Bag Filler– Auto Discharge)

Constructed of a HEAVY-DUTY structural steel frame, a stainless steel two piece fill spout, and integrated floor scale, the BagPak 2000 – offers automated ejection filling via inboard gravity conveyor lifted by Firestone air bladders. With the floor scale and controls, a bulk bag can be filled in bulk and dribble mode utilizing a valve to achieve desired weight. A compressed air expanded bladder seals the bag spout during filling, and is automatically released at target weight. By connecting the fill head dust port to factory dust collection, an optional cartridge filter, or filter sock, the entire fill cycle becomes a dust free operation. Other features include individually adjustable bag strap receiver arms and fill head that allow quick change for variable bag sizes, and fork pockets for easy mobility.

OPTIONS

- Scale, Controller, and Valve
- Bag inflation (inflates SuperSack™ prior to filling)
- Service Air Control System (allows for greater cfm control while using plant dust collection)
- All stainless steel construction
- Densification (gyrated bed for settling of product)
